Description

Type	Text	Date updated
Development	Tambar is a field in the southern part of the Norwegian sector in the North Sea, 16 kilometres southeast of the Ula field. The water depth is 70 metres. Tambar was discovered in 1983, and the plan for development and operation (PDO) was approved in 2000. The field has been developed with a remotely controlled wellhead platform tied-back to the Ula field. The production started in 2001.	13.12.2023
Reservoir	Tambar produces oil from Upper Jurassic shallow marine sandstone in the Ula Formation. The reservoir is at a depth of 4100-4200 metres and has generally very good quality.	09.12.2023
Recovery strategy	The field is produced by pressure depletion, with natural gas expansion combined with aquifer support. Gas lift is used to improve production performance.	28.02.2023
Transport	The oil is transported by pipeline to Ula. After processing at Ula, the oil is exported in the pipeline system via the Ekofisk field to Teesside in the UK, while the gas is injected into the Ula reservoir to improve oil recovery.	28.02.2023
Status	The production is declining due to decreased reservoir pressure and increasing water cut.	09.12.2023

Investments (expected)

The operators future investments related to the reservers from 2023 [mill NOK 2023-kroner]. The stated investment estimate has not been corrected for possible investment sharing.	79
