Description

Type	Text	Date updated
Development	Frigg is a field in the central part of the North Sea, straddling the border between the UK and Norwegian sectors. The water depth is 100 metres. Frigg was discovered in 1971, and the plan for development and operation (PDO) was approved in 1974. The field was developed with a living quarters facility (QP), two process facilities (TP1 and TCP2) and two drilling facilities (DP2 and CDP1). TP1, CDP1 and TCP2 had concrete substructures and steel frame topsides. The two other facilities had steel jackets. CDP1, TP1 and QP were on the UK part of the field. The facilities on the field also treated oil and gas from the fields Frøy, Nord Øst Frigg, Øst-Frigg, Lille-Frigg and Odin. The production started in 1977.	14.12.2023
Reservoir	Frigg produced gas from deep marine, turbiditic sandstone of Eocene age in the Frigg Formation, at a depth of 1900 metres.	14.12.2023
Recovery strategy	The field was produced by pressure depletion.	28.02.2023
Transport	The gas was transported via a 180-kilometre pipeline to the Shell-Esso Gas and Liquids (SEGAL) terminal at St Fergus in the UK.	28.02.2023
Status	Frigg was shut down in 2004, and final disposal of the facilities was completed in 2010. An appraisal well was drilled on Frigg in 2019. The development of the Yggdrasil area may provide an opportunity for a redevelopment of the field.	14.12.2023
