Description

Type	Text	Date updated
Development	Huldra is a field in the northern part of the North Sea, 16 kilometres west of the Veslefrikk field. The water depth is 125 metres. Huldra was discovered in 1982, and the plan for development and operation (PDO) was approved in 1999. The field was developed with a wellhead facility, including a simple process facility, and remotely operated from Veslefrikk B. The production started in 2001.	09.12.2023
Reservoir	Huldra produced gas and condensate from sandstone of Middle Jurassic age in the Brent Group. The reservoir is in a rotated fault block at a depth of 3500-3900 metres, and initially had high pressure and high temperature (HPHT). There are many small faults in the field and two main segments without pressure communication.	09.12.2023
Recovery strategy	The field was produced by pressure depletion and with low pressure production after 2007.	28.02.2023
Transport	The wet gas was transported to the Heimdal field and the condensate to Veslefrikk for processing and export.	09.12.2023
Status	Huldra was shut down in 2014, and the facility was removed in 2019.	09.12.2023
