

#### **Table 4: Discovery and Prospect data**

A new prospect form has been introduced, described in more detail below.

Each file shall include one prospect only (or lead or discovery). For prospects with alternative cases for hydrocarbon phases (oil vs gas vs oil&gas case) the cases shall be reported one by one, one worksheet per case - in the same file.

For input values with decimals, the legal decimal separator will be "." or "," dependent on the setup in your version of excel.

A listing with names of a selection of structural elements and litho- /chronostratigraphic names are attached in a separate work sheet in this file.

Cells coloured yellow are for NPD use only.

#### **Definitions:**

##### **Discovery**

One or several petroleum deposits discovered in the same well, in which through testing, sampling or logging there has been established a probability of the existence of mobile petroleum (includes both commercial and technical discovery).

##### **Prospect**

A possible petroleum trap with a mappable, delimited rock volume.

##### **Lead**

A possible petroleum trap where available data coverage and quality is insufficient for proper mapping and delimitation of the rock volume.

##### **Play**

A geographically and stratigraphically restricted area where a set of specific geological factors are present, making it possible to discover petroleum in producible quantities. Such geological factors are reservoir rocks, traps, mature source rocks and migration paths, and timing. All fields, discoveries and prospects within the same play are characterised by the play's specific set of geological factors.

##### **Risk analysis**

P1 = Probability of reservoir

P2 = Probability of trap

P3 = Probability of charge (source and migration)

P4 = Probability of retention after accumulation

Pdiscovery = probability of discovery of at least the estimated minimum volume (P100) = P1 x P2 x P3 x P4

In addition to probability of discovery, the conditional probability of each case should be specified (as fraction, where probability for oil case + gas case + oil&gas (multiphase) case = 1,0).

##### **Reservoir and fluid parameters**

All reservoir and fluid parameters shall be submitted with low (P90), base and high (P10) values.

The cut-off criteria for N/G calculation shall be entered as free text, to specify which cut-off values are used (for instance with regard to Vshale, porosity and permeability)

##### **Resources originally in place**

Comprise those volumes of petroleum resources originally in place in a deposit. The volumes shall be given at standard conditions.

##### **Resources originally recoverable**

Comprise volumes of the total saleable/deliverable petroleum resources, calculated for the period from the start to the end of production, and based on the current understanding of the volumes in place and recovery factor.

##### **Low estimates, base estimates and high estimates**

All resource estimates shall be submitted as a low (P90), base (mode and mean) and a high (P10) estimate.

##### **The low estimate - P90**

The low estimate will be lower than the base estimate. It shall be 90 % probability for the successful recovery of the given estimate or more. With reference to the base estimate value, the P90 value should reflect possible downsides with regard to the geometry of the reservoir, reservoir and fluid parameters, and/or recovery factor.

##### **The base estimate**

The base estimate will be the prevailing estimate, and shall reflect the current understanding of the reservoir geometry, reservoir and fluid parameters, and recovery factor. The base estimate should be reported both by the mean value and the mode value.

##### **The high estimate - P10**

The high estimate will be higher than the base estimate. It shall be 10 % probability for the successful recovery of the given estimate or more. With reference to the base estimate value, the P10 value should reflect possible upsides with regard to the geometry of the reservoir, reservoir and fluid parameters, and/or recovery factor.

##### **Recovery factor**

The proportion of the originally in-place resources which can be recovered from the prospect.
